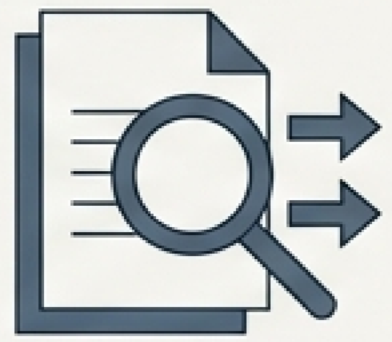
SarkarSathi

An AI-powered governance assistant engineered specifically for Indian elected representatives.

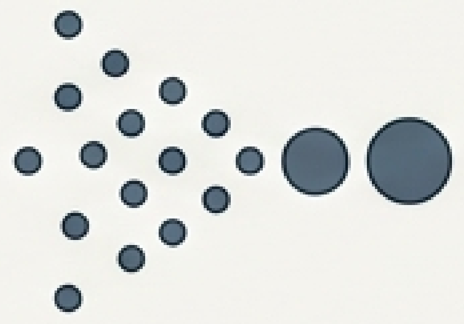
- Accountability
- Tracking
- Constituent Response

Transforming unstructured democratic chaos into actionable governance.



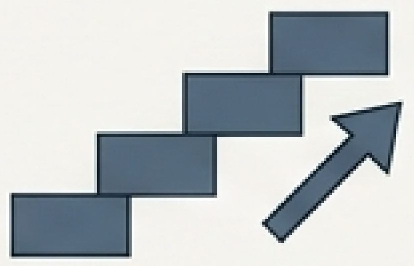
Transcript Extraction

Automated parsing of meeting records into actionable tasks.



Complaint Clustering

Grouping citizen issues by semantic similarity.



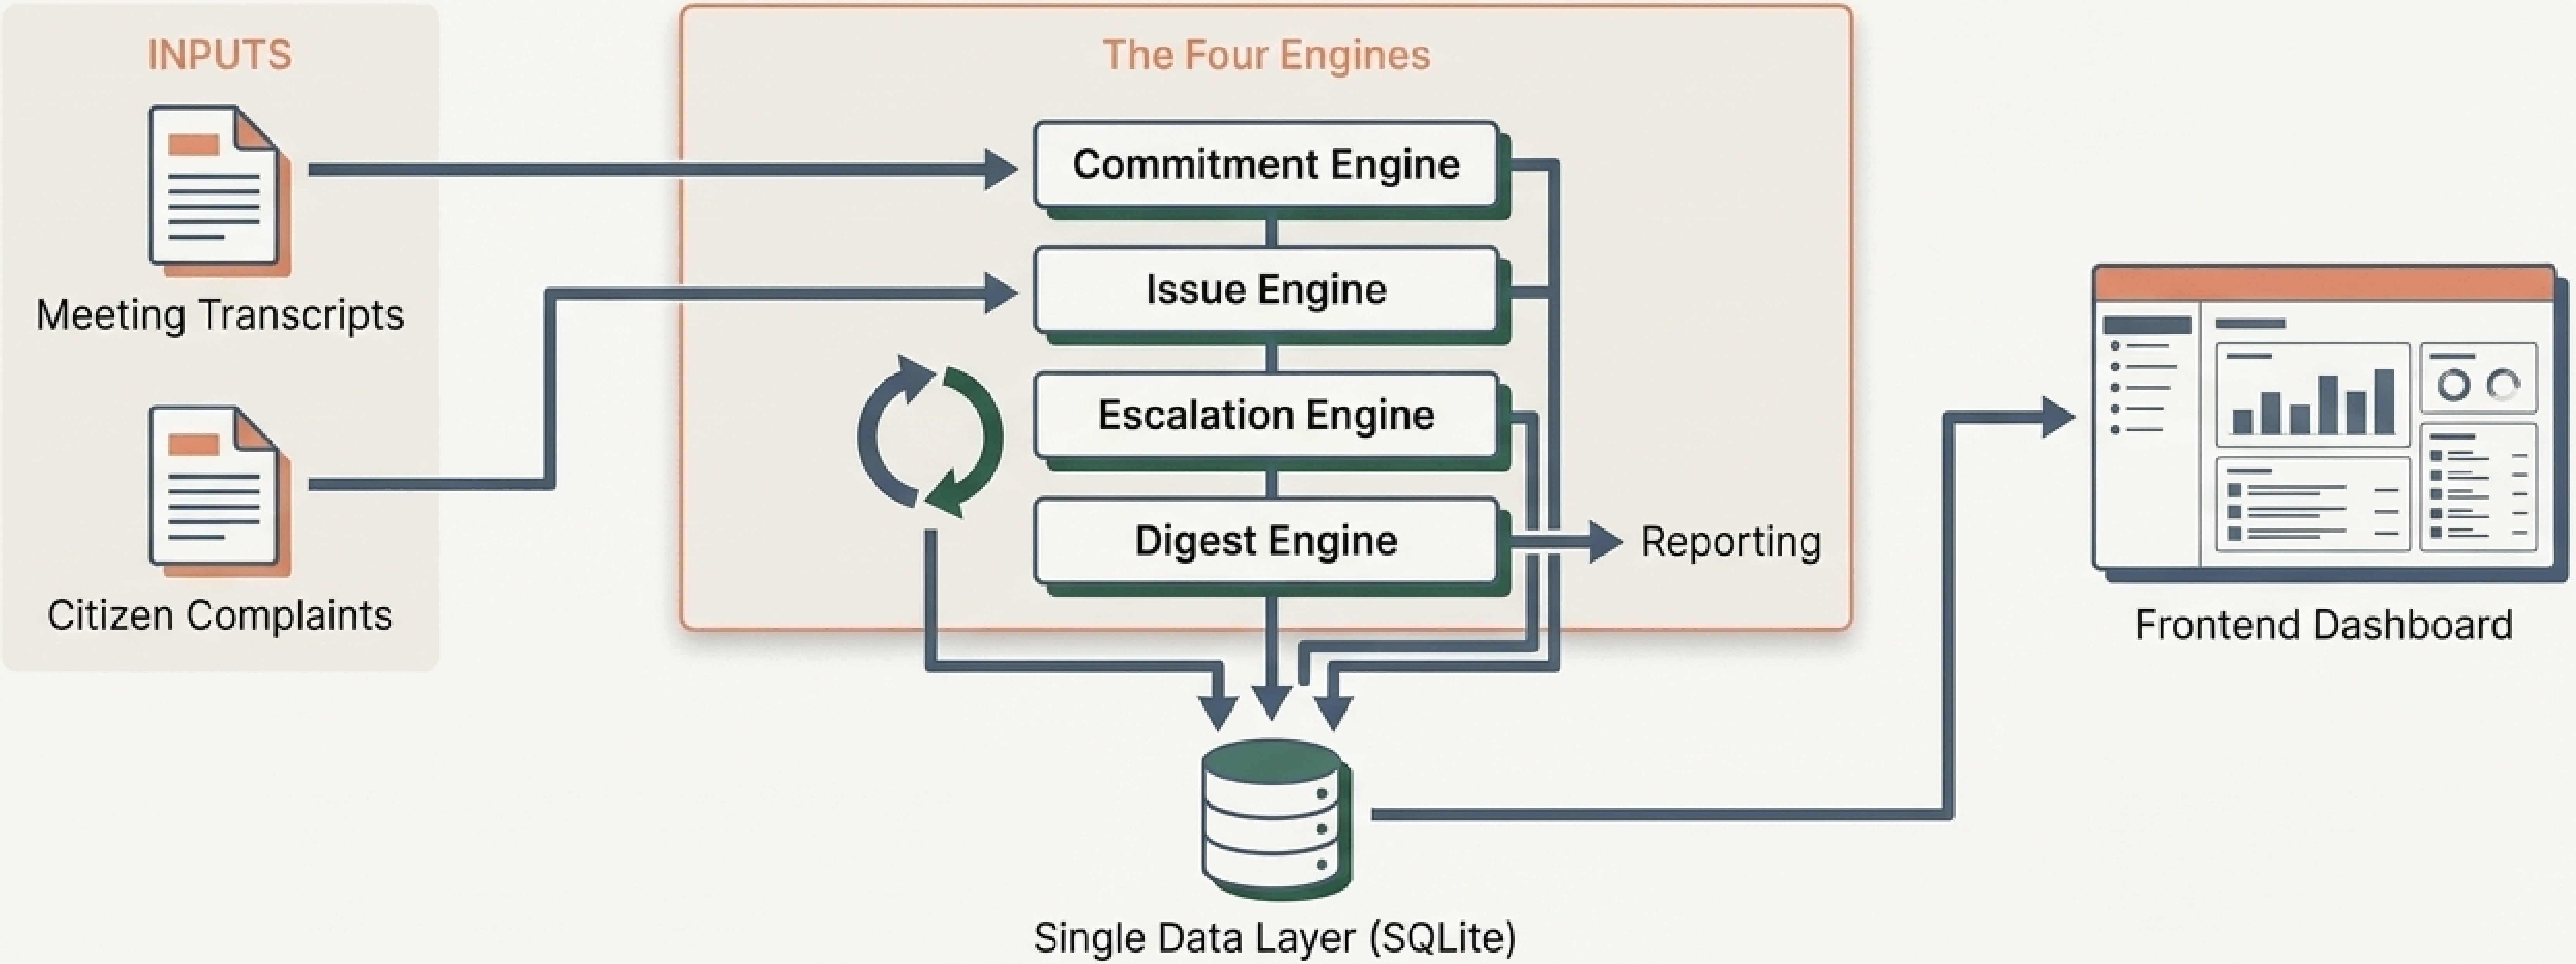
Auto-Escalation

Time-weighted urgency tracking for overdue items.

Accountability Digests

Weekly automated reporting on resolution rates.

A modular architecture built on four specialized processing engines.



Each engine operates independently but feeds into a single source of truth.

The Commitment Engine extracts and deadlines action items from raw traw transcripts.

INPUT

```
[Transcript Snippet]
...MLA Verma stated he will
personally ensure the water
logging in Ward 42 is fixed
by the PWD within five
days...
```

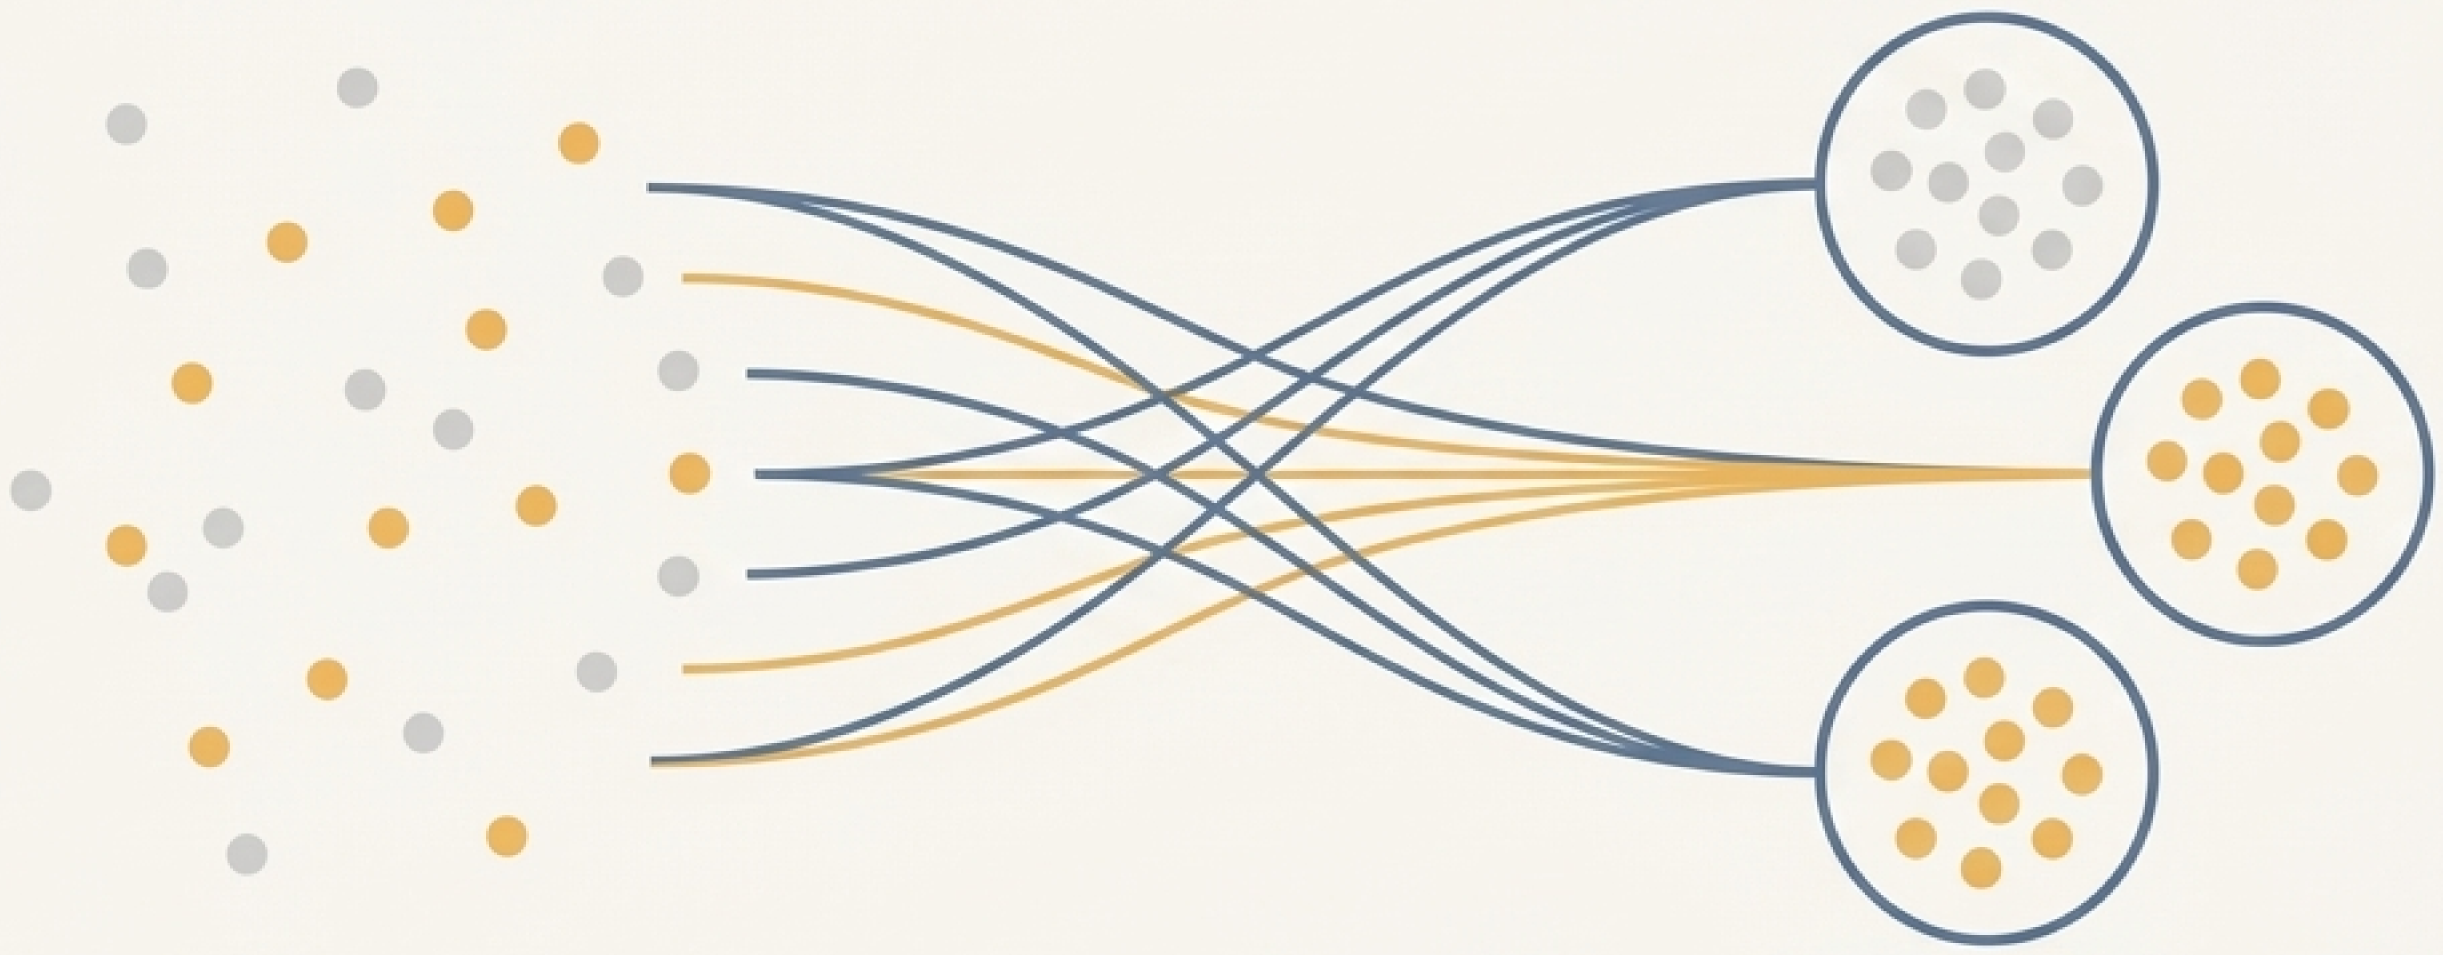
Powered by Gemini 3 Flash

OUTPUT

```json
{
  "title": "Fix water logging",
  "deadline": "2024-05-15",
  "to_whom": "PWD",
  "ward": "Ward 42",
  "type": "commitment"
}
```

- **Smart Inference:** Auto-assigns deadlines (Questions = 3 days, Actions = 5 days, Commitments = 7 days).
- **Graceful Degradation**: Defaults to storing raw text if API key is missing. Zero crashes.

The Issue Engine clusters citizen complaints using local vector embeddings.



100% Local Processing

Runs entirely without API dependencies for maximum privacy, security, and uptime.

Embedding Tech

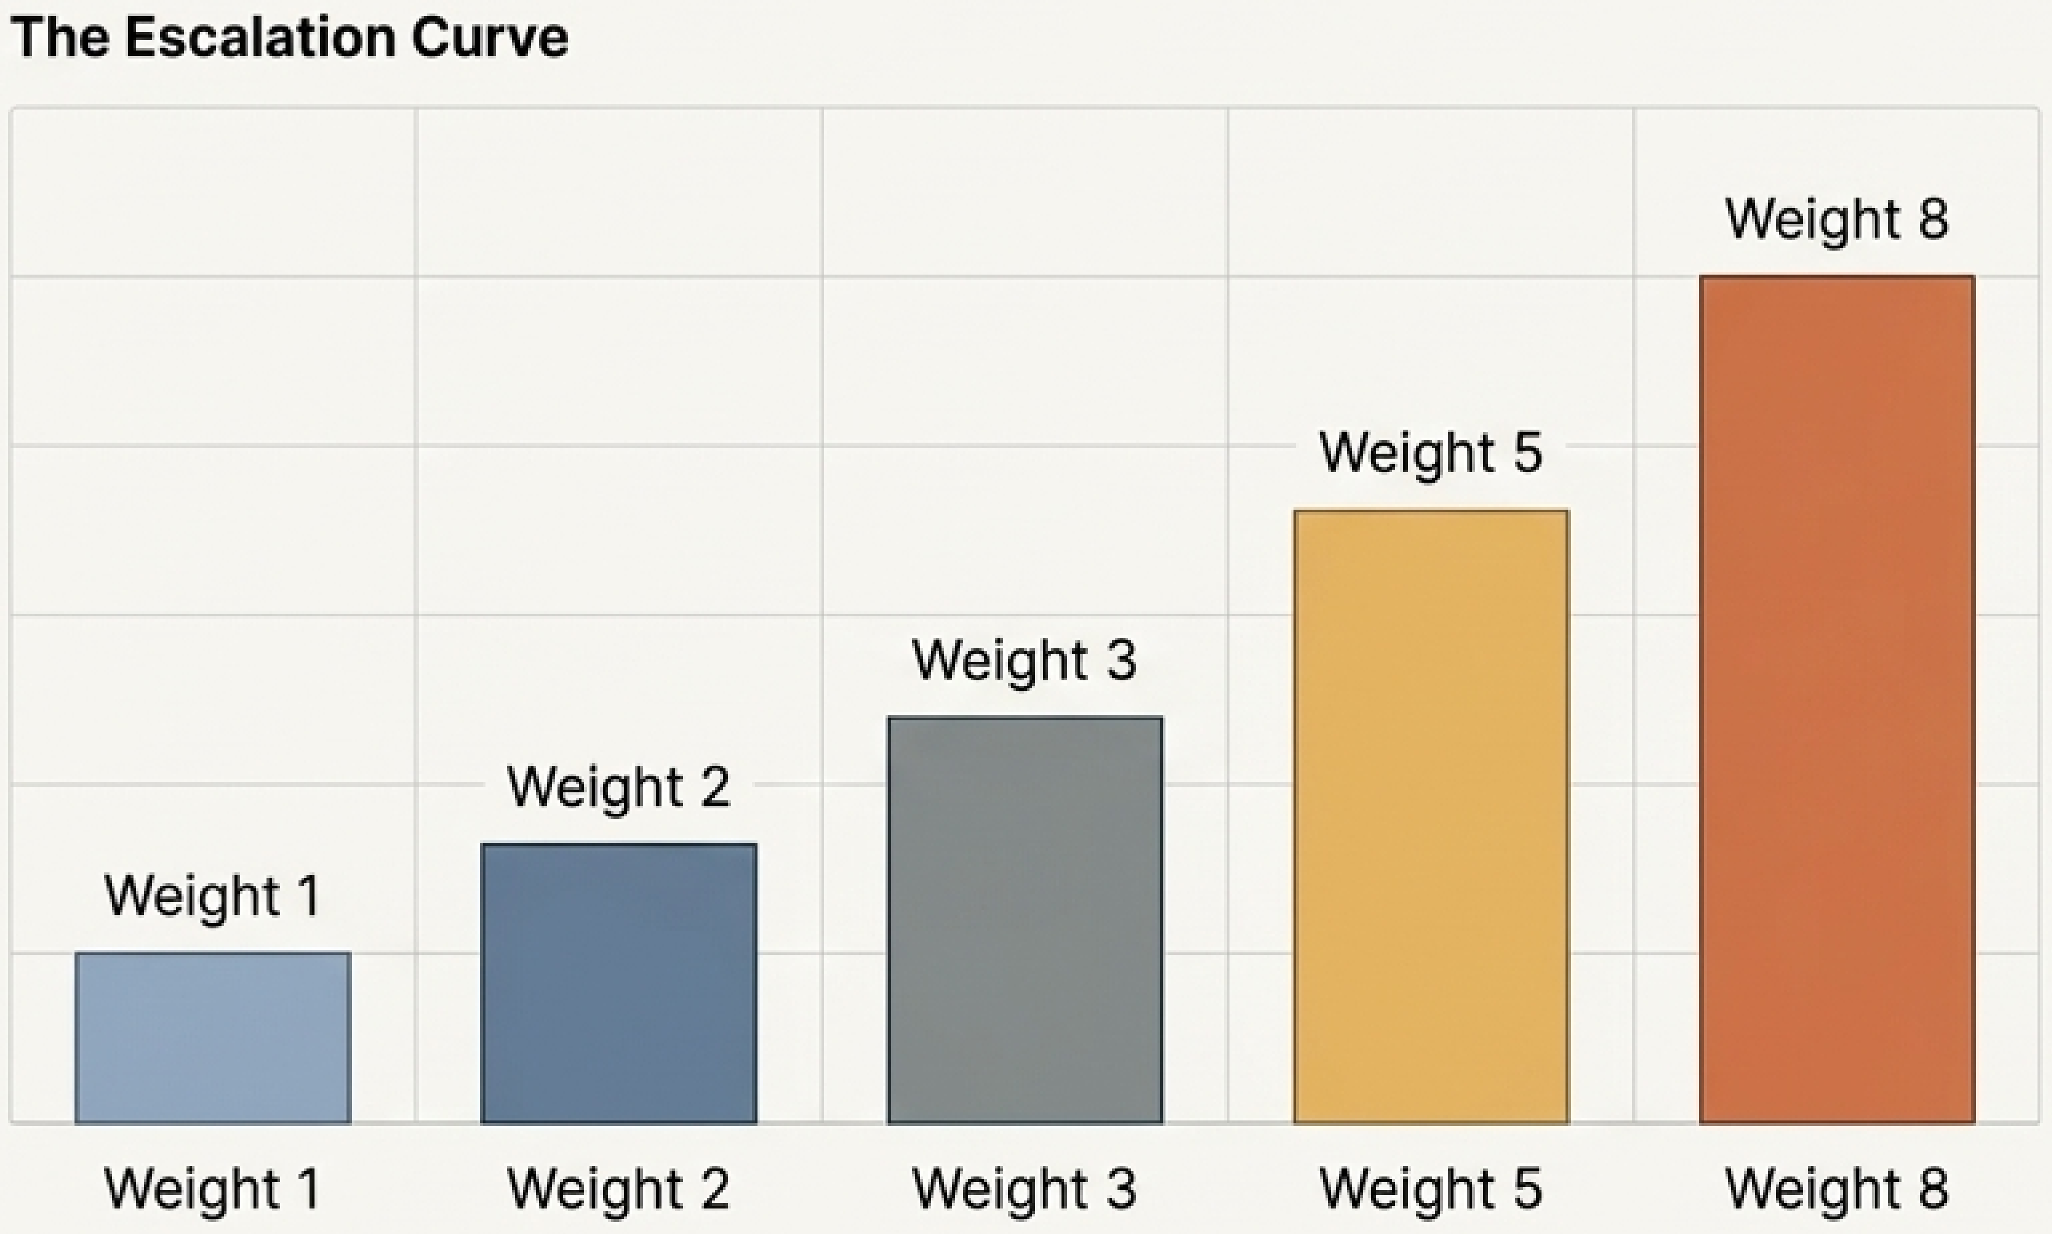
Utilizes mathematically precise sentence-transformers and the all-MiniLM-L6-v2 model.

Noise Reduction

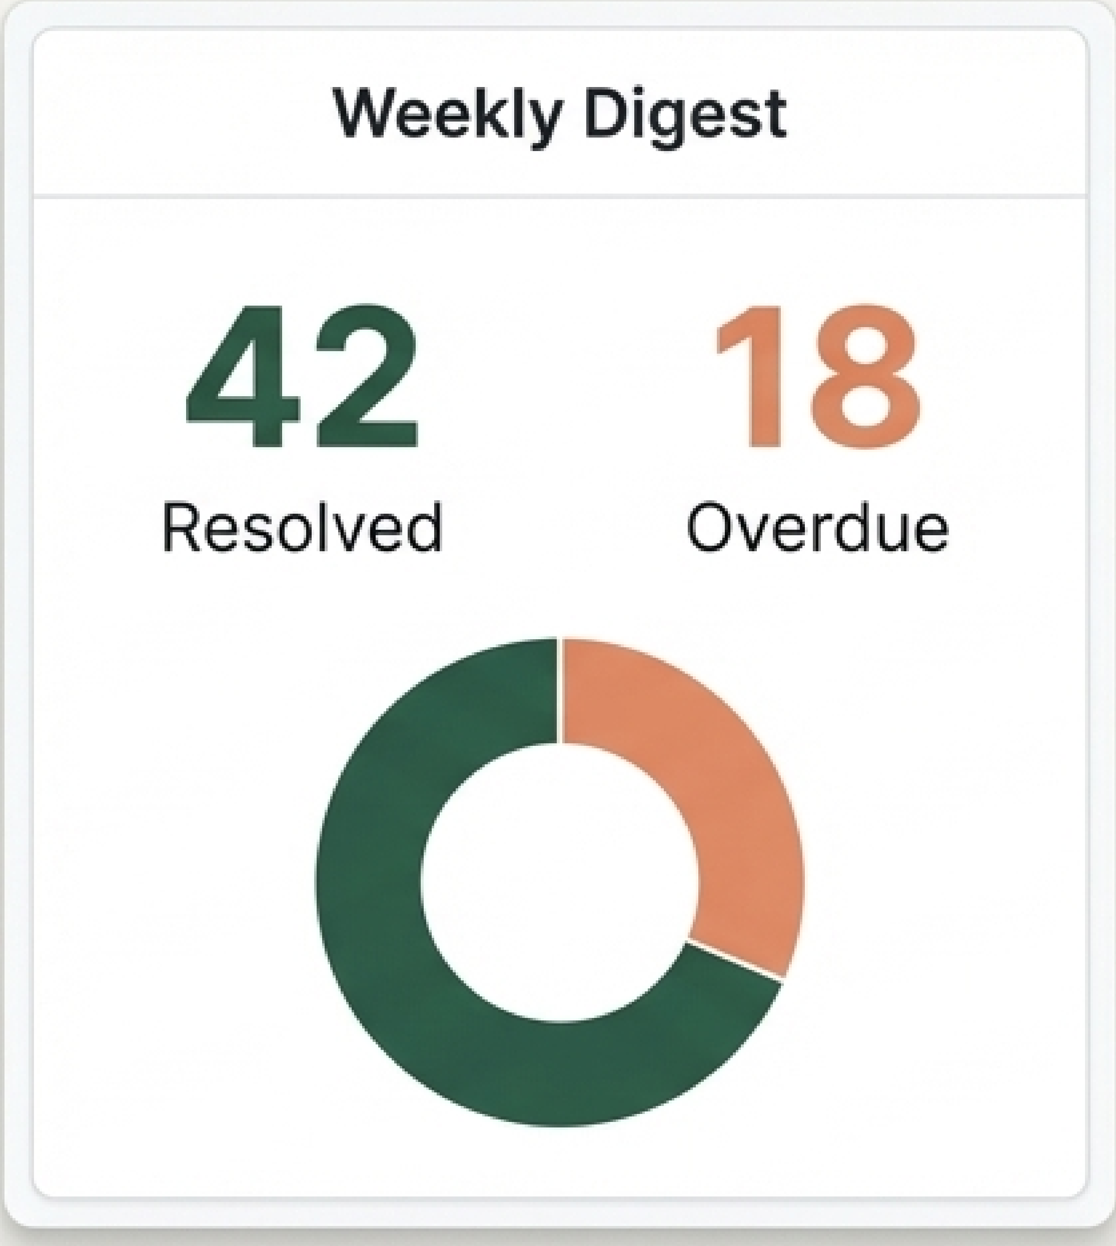
Automatically groups similar incoming issues to prevent dashboard clutter and highlight systemic problems.

Items actively demand attention through automated hourly escalation.

- Runs silently in the background every hour.
- Recalculates urgency for pending items based on days overdue.
- Excludes Issue Engine items, which maintain independent urgency weights set at ingestion.



The Digest Engine generates weekly accountability reports purely through SQL.

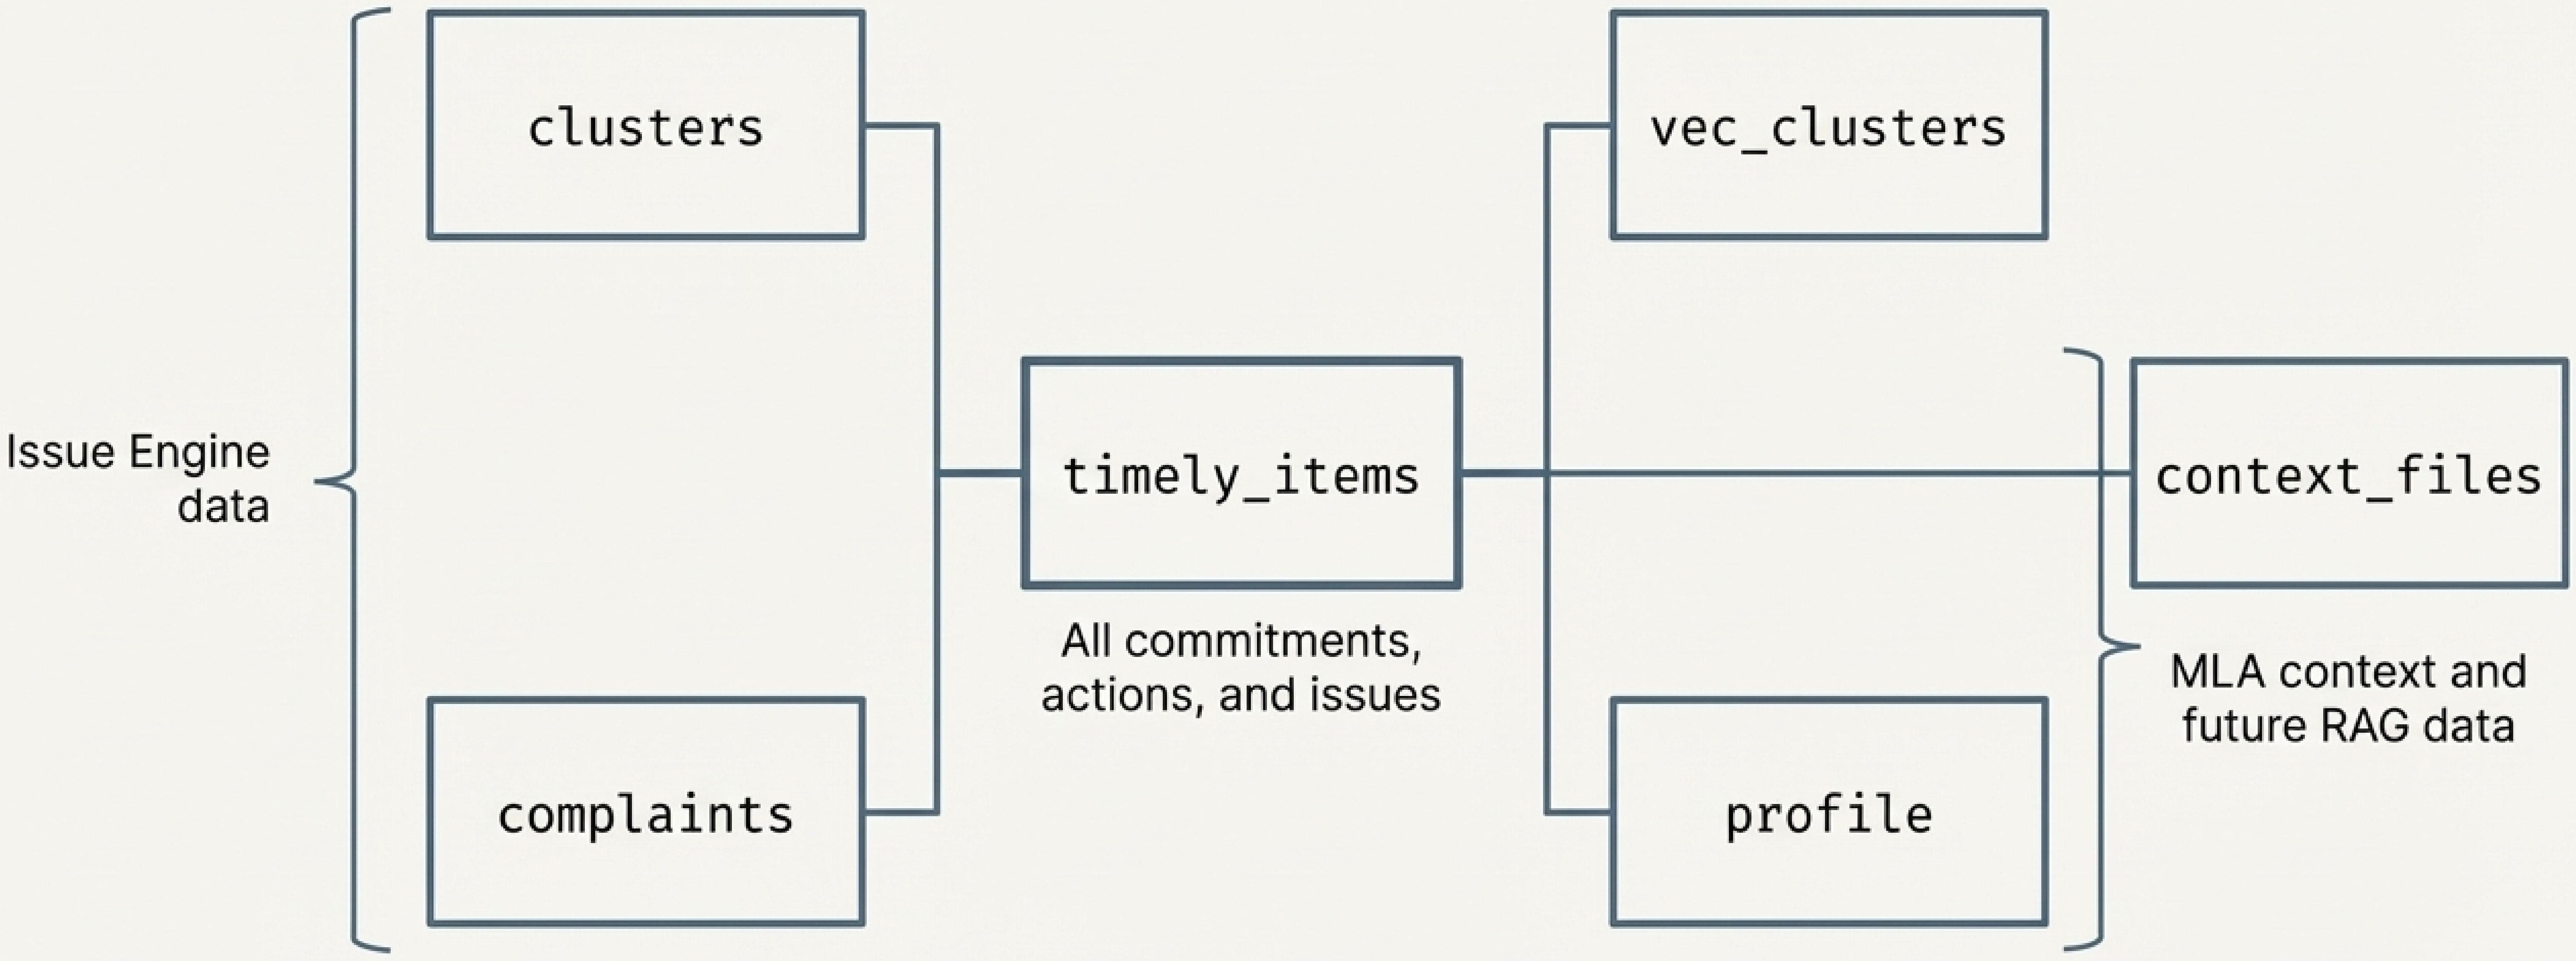


Zero LLM overhead required.

- Tracks new items categorized by type.
- Compares resolved vs. overdue items.
- Calculates overall resolution rates natively.
- Surfaces the single most overdue item instantly via query.

A unified SQLite data layer holds the systere system together.

Single file deployment: copilot.db



NotebookLM

Deep localization adapts the system to the specific elected representative.

Shri Rajendra Kumar Verma

Profiler sict of elected representative.

- Rajendra Kumar Verma
- Shri Rajendra India
- 27 May, 2016
- Consmsarant (tnative India)
- English
- Shri Rajendra Kumar Verma

Persistent Profile Data

- Persistent data thas not corvequent in yedar and with crewcends persistent as a ingent.
- Elomins profile data manorratind in Shri daw at the IOH.

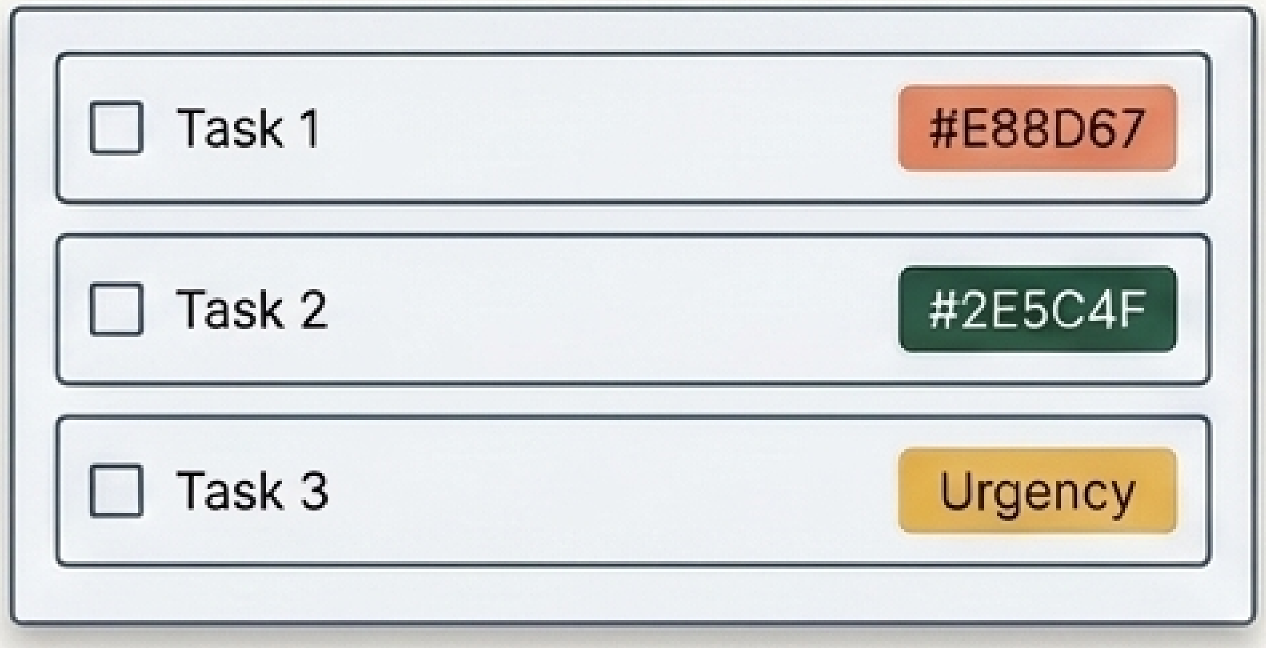
Context Injection

- Context Injection wnows persistent profile data, tower nourat injectent.
- Get assulized to coorab leabls.
- Context Injection with elements settlement.

Demo Data

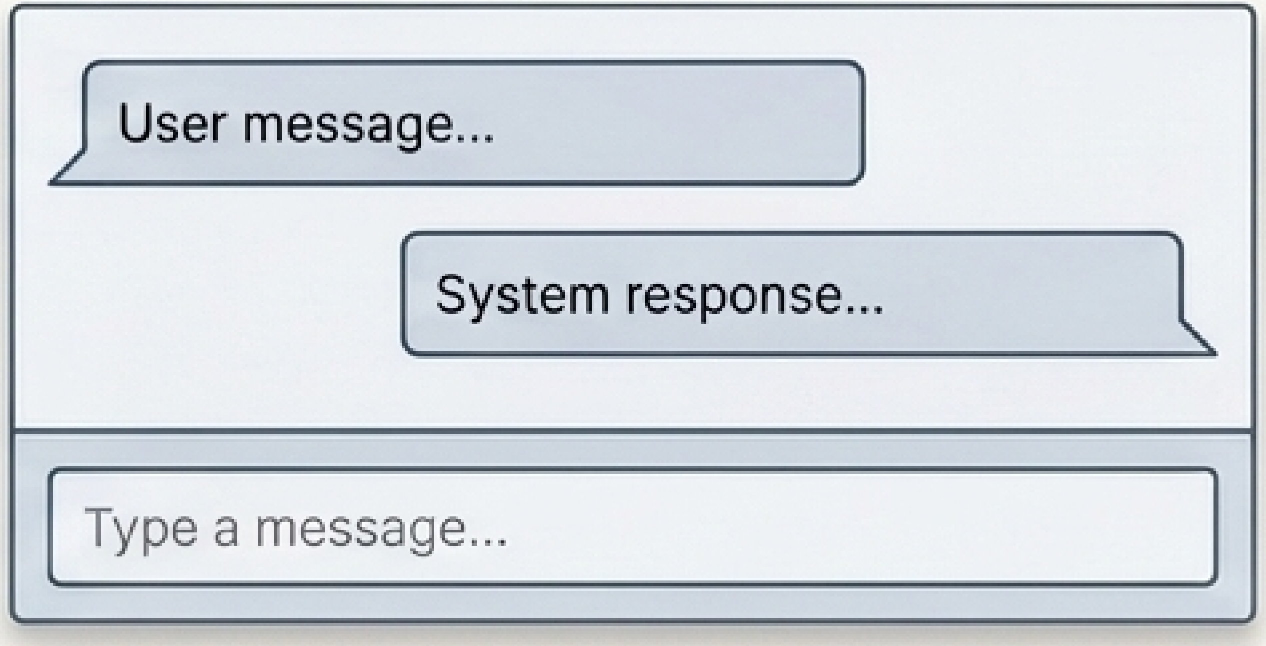
The frontend dashboard translates complex processing into intuitive workflows.

Live Now



- Home overview
- To-Do list (ranked by dynamic weight)
- Active/resolved Commitments history
- Meeting uploads & issue logging

Mockups



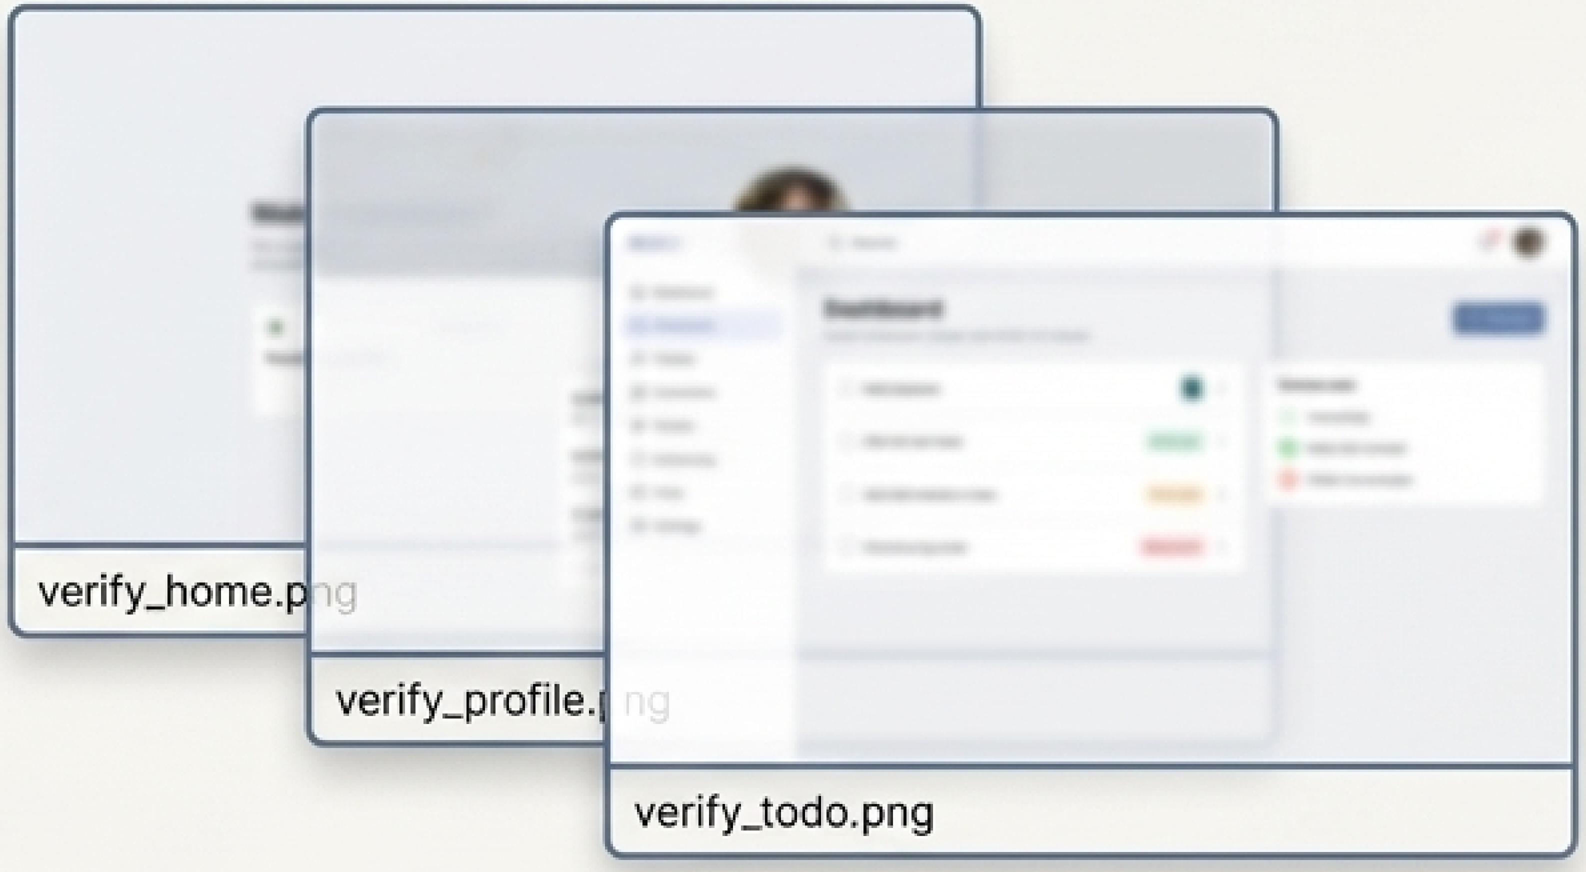
- Conversational Chat interface
- Smart Suggestions

Automated Playwright verification ensures seamless frontend-backend integration.

verify_dashboard.py

```
import playwright

def run_verification():
    navigate_live_pages()
    complete_and_extend_items()
    log_complaints()
    capture_state()
```



End-to-end automated testing script.

Navigates live pages, completes and extends items, logs complaints, and updates profiles.

Captures exact state at every step to guarantee reliability before deployment.

Proto3 roadmap shifts the system from passive tracking to active assistance

The RAG Engine

Embedding local context files and commitment history to power conversational Chat and Suggestion modules.

Demo Readiness

Compiling richer, more complex seed data for advanced platform demonstrations.

Live API Integration

Opening the /api/complaints/recent endpoint to ingest real-time issue entries.

Last updated: 7th of March. The repo may be updated to new versions wl
